                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a probe used to detect polymorphisms in the human osteoclastogenesis inhibitory factor (TMRSF11B). Polymoleotides comprising one or more of twenty four novel single nucleotides polymorphisms in the TMRSF11B gene have been identified. TMRSF11B regulate osteoclast recruitment and function. An understanding of variations in the gene should thus be useful in developing new therapies for metabolic disorders caused by abnormal osteoclast recruitment and function such as osteoporosis, metastatic bone disease, reget's disease, rheumatoid arthritis and periodontal bone disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human Osteoclastogenesis Inhibitory Factor nucleotides, comprising single nucleotide polymorphisms, useful for studying e.g. osteoporosis, Paget's disease and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, TNFRSF11B; osteoclastogenesis inhibitory factor; single mucleotide polymorphism; SNP; osteoclast recruitment; osteoclast incrion; osteoporosis; metastatic bone disease; Paget's disease; rheumatoid arthritis; periodontal bone disease; ASO; allele-specific oligonucleotide; probe; ss.
                                                                                                                                                                                                                                                                                                                                       .

                                                                                                                                                                                                                                                                                                                                  The present sequence is a probe used to detect polymorphisms in the human osteoclastogenesis inhibitory factor (TNRRSF11B). Polymucleotides comprising one or more of twenty four novel single nucleotide polymorphisms in the TNRRSF1B gene have been identified. TNRRSF1B regulate osteoclast recruitment and function. An understanding of variations in the gene should thus be useful in developing new therapies for metabolic disorders caused by abnormal osteoclast recruitment and function and as osteoporosis, metastatic bone disease, Paget's disease, rheumatoid arthritis and periodontal bone disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human Osteoclastogenesis Inhibitory Factor nucleotides, comprising single nucleotide polymorphisms, useful for studying e.g. osteoporosis, Paget's disease and rheumatoid arthritis.

The probe can be used for the detection of a target virus. The present sequence is a probe described in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               energy donor fluorescent pigments (dfp) and an energy acceptor fluorescent pigment (afp) in which the energy from (dfp) is relayed to (afp) successively and transferred.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting a virus comprises a probe formed between at least two same

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides the protein, cDNA and genomic sequences of human intersleukin-13 [ILI3], and describes the single mucleotide polymorphisms (SNPs) found within the gene, which is found on chromosome 5q31. ILI3 is a pro-inflammatory cytokine thought to be involved in the pathogenesis of asthma and other immune and inflammatory diseases. The ILI3 sequences and the SNPs identified can be used in drug screening, to determine an individual's susceptibility to disease, in forensic and paternity testing, and to identify reatments for cancer, immune and inflammatory diseases, including ashma and diseases characterised by fibrosis. The present sequence is an ILI3 allele-specific oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                 Human, interleukin-13, ILL3; single nucleotide polymorphism; SNP; cancer; inflammation; immune disorder; cytokine; asthma; chromosome 5q31; fibrosis; forensic; disease susceptibility; drug screening; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel polynucleotide comprising single nucleotide polymorphisms in human interleukin-13 gene is useful for studying expression and function of interleukin-13, as well as diagnosing and treating cancer, inflammatory, and immune disorders.

Producing copies of specific nucleic acids in vitro, without the need of intermediate structures, useful for determining if samples have come from living or dead organisms.
                                                                                                                                                                                                                                                  The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and crohn's disease. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 M13mp18; living organism; dead organism; nucleic acid copying; isostatic condition; temperature; buffer; ionic strength; PCR primer; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for producing, in vitro, copies
                                                                                                                                                    Testing for the presence of polymorphisms associated with inflammatory bowel disease, using a hybridization assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Donegan JJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel nucleotide carrier with probes used for diagnosis of oral diseases, particularly paradontitis, but also caries, especially to identify genetic predisposition (as indicated by polymorphisms) to disease and to identify causative microorganisms or their associated virulence factors and antibiotic resistance genes, e.g. for selection of therapy and for prognosis. They are also useful for research into oral infections. The carriers allow simultaneous detection of both host and pathogen parameters, providing quickly and simply an individual's paradontitis profile, including detection of pathogens that aggravation of minimarsased risk of coronary heart diseases and/or aggravation of most compary heart diseases and/or aggravation (Updated on 06-AUG-2003 to correct OS field.) of a specific nucleic acid. The process does not require the use of intermediate structures for the production of the nucleic acid. The method comprises: (a) providing a nucleic acid sample containing the specific sequence; (b) contacting the sample with a mixture containing: (i) nucleic acid precursors; (ii) specific nucleic acid primars, each complementary to a distinct region of the sequence; and (iii) a nucleic acid producing catalyst; and (c) allowing the mixture to react under isostatic conditions of temperature, buffer and ionic strength. The method can be used for producing copies of specific nucleic acids in vitro. The process can be used to determine if a specific target nucleic acid was derived from a living or deceased organism. The present sequence represents a PCR primer for the Milmpils nucleotide sequence which is used in an example from the present invention. (Updated on 11-SEP-2003 to

Polymucleotides comprising single nucleotide polymorphisms in the human dopamine receptor D2, useful for detecting mutations associated with, e.g. schizophrenia, Parkinson's and myoclonus dystonia.

Claim 15; Page 23; 135pp; English.

The present invention describes polynucleotides comprising single mucleotide polymorphisms (SNPs) in the human dopamaire receptor D2 (DRD2). The polynucleotides may be used in assays to detect and characterise polymorphisms in DRD2 that affect its expression and activity and are prolymorphisms in DRD2 that affect its expression and activity and are involved in disorders such as schlizophrenia, Parkinson's and myoclonus dystonia (MD). This information would be useful for studying the biological function of DRD2 as well as in identifying drugs targeting this protein for the treatment of disorders related to its abnormal expression or function. Polymorphisms in the DRD2 gene affect the expression of active and functional polypeptides. Therefore it is

The present invention relates to polymorphisms of the human interleukin 4 receptor-alpha gene (IL4R-alpha; see AAF57718 for the reference sequence). Polymorphica comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular IL4Ralpha protein isoform, an expression vector encoding the isoform may be administered to the patient. It may desirable to decrease or block expression of a particular IL4Ralpha protein isoform, and the appression of a particular IL4Ralpha isogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRMA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a probe for human IL4R-alpha
advantageous to detect polymorphisms in the DRD2 gene and how those polymorphisms are combined in different copies of the gene. AAF70261 to AAF70305 represent human DRD2 allele specific oligonucleotide probes, and AAF70309 to AAF70404 represent human DRD2 allele specific oligonucleotide primers which are used in the detection of DRD2 polymorphisms. AAF70405 propresent oligonucleotide primers for the detection of human DRD2 polymorphisms which are given in the exemplification of human DRD2 polymorphisms which are given in the exemplification of the present invention. AAF70453 to AAF70538 represent PCR primers for the human DRD2 gene which are used in examples from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotide useful for the identification of therapeutics

The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotronin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing a recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonuclectide is used to detect a polymorphism in the SLC6A4
Solute carrier family 6 neurotransmiter transporter, sectonin 4; SLC6A4; genotyping; allele specific oligonuclectide; ss.
                                                                                                                                                                                                                                                                                                                                      New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member gene for identifying drugs for treating disorders related to expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Spidroin; spider; silk; fibre; film; membrane; wound; filter; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing a recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC6A4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 gene for identifying drugs for treating disorders related to expression
                                                                                                                                                                                                                                                                                                            Solute carrier family 6 neurotransmiter transporter; sectonin 4; SLC6A4; genotyping; allele specific oligonuclectide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

This invention describes a novel DNA sequence, encoding a synthetic spider silk protein, comprising modules, each comprising a group of sequentially arranged oligonucleotide encoding a repeating unit of a spidroin protein. Psynthetic protein has at least sproduce synthetic fibres, films and/or membranes, particularly: (i) sproduce synthetic fibres, films and/or membranes, particularly: (i) for medical use, especially to close wounds and/or to support or cover artificial organs; (ii) as adhesion surfaces for culturing cells; and artificial organs; (ii) as adhesion surfaces for culturing cells; and (iii) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity). Also they retain water solubility after long-term boiling in aqueous continuous and since they are also soluble in organic solvents but precipitated at high salt concentration, they are easily extracted and purified. The modular construction of the invention facilitates continuous and surfaces and continuous encourage of additional peptide-encoding sequence represents a N. culturing continuous continu
New DNA encoding synthetic spider silk protein, useful e.g. for closing wounds, comprises modules that encode repeating units of spirodoin

Identifying strain of prokaryote or individual of eukaryote, useful in clinical laboratories for strain identification of pathogenic bacteria,

The present invention relates to a new method of identifying strain of prokaryote or individual of eukaryote. This method involves amplifying a prokaryote or individual of eukaryote. This method involves amplifying a prokaryote or the HOR of DNA filanks a highly variable region (HVR) of eukaryote, where the HOR of DNA sequences which are labelled, and fragments that are separated fragmented to yield labelled, amplified DNA ragments that are separated breathors as that prokaryote or eukaryote or entaryote or an electrophoresis so that prokaryote or eukaryote or entaryote or an entaryote or an entaryote or entaryote or an entaryote or entaryote or an entaryote or entaryote. The method is prokedine or of infections, and for identifying species, sub-species and the differences between the individuals of the sub-species of the same species. The differences between e.g. bacterial strains involved in e.g. nosocomial or expect to a eukaryote. The method is sensitive enough to detect of entaryote individuals of the sub-species of the same species. The expect of DNA. The methods are beneficial in clinical laboratorie, because they allow for rapid strain identification of pathogenic bacterial DNA is analysis, and completed sequence or provides results with great speed e.g. a proliminary screen by agarcse or provides results with great speed e.g. a proliminary screen by agarcse or completed 5-6 hours after receiving hospital isolates. The method or fragment the spread of nosocomial infection control personnel with adequate information to contain and prevent the spread of nosocomial infections, rather than having analysis (RPLP) The speed of the methods of the invention, as described above. ò . 0 0.5%; Score 10.8; DB 1; Length 15; 85.7%; Pred. Novel isolated polymorphic variant polynucleotide of lecithin-cholesterol acyltransferase gene, useful for studying expression and biological function of the gene, and for therapeutic, diagnostic or forensic Stephens JC; Nandabalan K, Claim 16; Page 17; 72pp; English. (GENA-) GENAISSANCE PHARM INC. WPI; 2002-557737/59 purposes.

The present invention relates to a new polynucleotide comprising a nucleotide sequence which is a polymorphic variant of a reference sequence which is a polymorphic variant of a reference sequence for lecithin-cholesterol acyltransferase (LCAT). The invention is useful for identifying an association between a trait (preferably a clinical response to drug targeting LCAT) and at least one genotype or haplorype of LCAT gene. The method of the invention has applicability in developing diagnostic tests and therapeutic treatments for Norum disease, fish-eye disease and atherosclerctic cardiovascular disease. The haploryping and genotyping methods are useful for studying population diversity, anthropological lineage, the significance of diversity and lineage at the phenotypic level, paternity testing, forensic applications and a read association between the LCAT genetic variation and a trait such as level of drug response or susceptibility to disease. In addition, the methods for identifying the LCAT paplotypes present in addition, the methods for identifying the LCAT paplotypes in a condition with a specific disease, e.g. Norum disease, will facilitate the development of drugs targeting the LCAT haplotypes in a population with a specific disease, e.g. Norum disease, will facilitate the development of drugs targeting the LCAT isoform(s) that are most regerents one of a collection (ABMSy44B-ABMSy441) of allele specific represents one of a collection (ABMSy44B-ABMSy441) of allele specific oligonucleotide (ASO) probes that were used in the invention to detect colymorphisms in the human LCAT gene

screening New genetic variants comprising haplotypes of the human Platelet Activating Factor Receptor (PTAFR) gene, useful for treating or scre drugs for treating e.g. inflammatory diseases, coronary diseases or comprising haplotypes of the human Platelet

Claim 15; Page 13; 59pp; English.

The present sequence represents an allele-specific oligonucleotide (ASO) probe which is used for detecting polymorphisms in the human platelet activation as PSI-5 to designate the order in which they are located to as PSI-5 to designate the order in which they are located in the gene. Six isogenes of the PTARR gene exist. The PTARR gene is located on chromosome 1, and contains 1 exon. Polymorphisms PSI and PSS have previously been identified. PSI and PSS cocur in the coding region. The polymorphisms polymorphisms in the PTARR gene is useful in screening candidate drugs to treat diseases related to PTARR activity, e.g. inflammatory diseases, coronary diseases or cancer. The PTARR isogenes are especially useful for treating these diseases. The methods and haplotypes are useful in improving the efficiency of drug discovery and development processes, or for designing clinical trials of candidate drugs for treating the specific condition or disease described

The present invention relates to a method for amplifying nucleic acid.

The method comprises annealing a primer (PI) to first strand (S1) of denatured target nucleic acid (dNA) at annealing temperature (T1);

catending P1 at T1 or extension temperature (E1) to generate doublestended (ds) nucleic acid, annealing primer (P2) to second strand (S2) of dNA at annealing temperature (T2); extending P2 to generate double.

Cof dNA at annealing temperature (T2); extending P2 to generate double.

Cof dNA at annealing temperature (T2); extending P2 to generate double.

Cof dnaturing target danA into S1 and S2. A probe hybridisation step may be incorporated into the cycle. A detectable probe is annealed to S2 of denatured target uncleic and s2. A probe hybridisation enthod is useful for amplifying target nucleic acid, preferably a plasmid, cDNA, amplicon, genomic DNA, restriction digest or a ligation product, or a target comprising single nucleotide polymorphisms. The asynchronous PCR cycle has utility in nuclease cleavage assay with a cleaving DNA flucrescence resonance energy transfer (PRET) probe, in assays for human disease diagnosis, food-borne pathogen detection and microbial detection, for allelic discrimination of target DNA, and in genotyping and gene expression analysis. The present sequence is a PNA PRET probe, which was used to illustrate real-time detection of
                                                                                                                                                                                                                                                                                                                                               nucleic acid, involves two annealing and two extension steps employing two primers which differ in their thermal melting temperatures.
                                                                                                                                                                                                                                                                                                                     Novel asynchronous thermal cycling method for amplification of target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for amplifying nucleic acid.

The method comprises annealing a primer (P1) to first strand (S1) of denatured target nucleic acid (ANA) at annealing temperature (T1).

Stranded (ds) nucleic acid, annealing primer (P2) to second strand (S2) of ANA at annealing temperature (T2); extending P2 to generate doublestranded (ds) nucleic acid, annealing primer (P2) to second strand (S2) of ANA at annealing temperature (T2); extending P2 to generate dsNA; chanturing target dsNA into S1 and S2. A probe hybridisation step may be incorporated into the cycle. A detectable probe is annealed to S2 of construct target nucleic acid at a probe hybridisation step may be incorporated into the cycle. A detectable probe is annealed to S2 of construct target nucleic acid, preferably a plasmid, cDNA, amplicon, genomic DNA, restriction digest or a ligation product, or a target comprising single nucleotide polymorphisms. The synchronous PCR cycle has utility in nuclease cleavage assay with a cleaving DNA flucrescence resonance energy transfer (FRET) probe, in assays for human disease diagnosis, food-borne pathogen detection and microbial detection, for allelic discrimination of target DNA, and in genotyping and gene expression analysis. The present sequence is a PNA PRETER PRODE, which was used to illustrate real-time detection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

The invention relates to a method for amplifying a nucleic acid using a Single Primer Amplification (SPA). The method comprises synthesising a capplate nucleic acid containing a predetermined sequence and hairpin a tructure with the nested oligonoclecicle excension reaction. The method structure with the nested oligonoclecicle for amplifying a nucleic acid, preferably for amplifying a capple of family of related nucleic acid sequences to build a complex library of capples encoded by the sequences. The engineered nucleic acid strand to polypeptides encoded by the sequences. The engineered nucleic acid strand caid with a predetermined sequence engineered onto its first end, a sequence complementary to the predetermined sequence and a hairpin structure between them and contacting the engineered onto its first end, a structure between them and contacting the engineered and a hairpin structure between them and contacting the engineered and entition such a portion of the predetermined sequence. This process is done in the presence of a polymerase and concludes under conditions suitable for polymerisation to produce a complementary nucleic acid strand. The method of the invention is useful for producing large amounts of a target nucleic acid sequence and for amplifying simultaneously more than one different target nucleic acid
and for identifying associations between AGTR2 genetic variations and a trait such as levels of drug response or susceptibility to disease. It is useful in developing diagnostic tests and therapeutic treatments for eardiovascular disorders, congenital abnormalities of kidney and urinary tract (CAKUT) and premature ovarian failure (POF). The invention is useful in gene therapy. The present sequence is an allele-specific oligonuclectide (ASO) primer used to detect human AGTR2 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Amplifying nucleic acid by synthesizing template nucleic acid containing a predetermined sequence and hairpin structure and using the template for target amplification by Single Primer Amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Single Primer Amplification; nested oligonucleotide extension reaction; hairpin; SPA; library; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to genetic variants of human angiotensin receptor 2 (AGTR2) isogenes and methods for detecting variants of AGTR2 gene. Polynuclectides of the invention are useful in studying the expression and biological function of AGTR2 and in developing drugs targetting AGTR2 protein. Methods of the invention are useful for studying population diversity, anthropological lineage, the significance of diversity and lineage at the phenotypic level, paternity testing, forensic applications
                                                                                                                                                                                                     Measurement of nucleic acids, using a nucleic acid probe and analysis of
                                                                                                                                                                                                                                                                                                                                     This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorescence of the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; angiotensin receptor 2; forensic application; drug response; AGTR2; congenital abnormality of kidney and uninary tract; CAKUT; cardiovascular disorder; premature ovarian failure; gene thorapy; POF; polymorphism; ASO; allele-precific oligonucleotide; primer; ss.

                                                                                                                                                    g
                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3.5' linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful to binding to a DNA duplex target sequence via either CT or GT triplex helix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and for modulating target gene expression. They are also useful in gene therapy. The present sequence is a target DNA used in the exemplification
                                                                                                        ö
                                                                                                                                                                                                                                                                                                         Antisense therapy, infection, cardiovascular disorder, immune reaction, gene therapy, virucide, cytostatic, antibacterial, antiinflammatory,
sequence located on the same or different nucleic acid molecules. This polynucleotide sequence represents an oligonucleotide relating to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New oligomers useful for binding to DNA duplex target sequence and for treating e.g. diseases caused by viruses and inflammatory conditions comprise at least three 3'-5' linked nucleosides.

The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3.-5. linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful of the invention active one nucleoside of the invention are useful of the invention and diseases such as treating diseases caused by viruses and for diagnostic applications to detect viral infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions.

The rappy, The present sequence is a target RNA used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             note= "5-methyl-2'-deoxycytidine; This base is given as I in the sequence shown as SEQ ID NO: 8 in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /*tag= b

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3.-5. Innked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful for inhiding to a DNA duplex target sequence wit a either or or off triplex theix binding motif and in antisense therapies. They are also used for treating diseases caused by virtuses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primamatory conditions, cardiovascular disorders, immune reactions and bacterial infections and therapy. The present sequence is an oligonucleotide useful in gene therapy. The present sequence is an oligonucleotide useful in the

The present invention relates to novel cligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3 -5. linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside comprises a base. Sequence of the invention are useful of the invention are useful of the invention of the invention are useful the invention of the invention are useful of the invention o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomere comprises at least three 3.5' linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful to binding to a DNA duplex target sequence via either CT or GT triplex helix binding motif and in antieense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and acterial infections and for modulating target gene expression. They are also useful in gene therapy. The present sequence is an oligomucleotide used in the
                                                                                                                                            This base is
ID NO: 31 in the
N in the sequence shown as SEQ ID NO: 31 in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New oligomers useful for binding to DNA duplex target sequence and for treating e.g. diseases caused by viruses and inflammatory conditions comprise at least three 3'-5' linked nucleosides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gutierrez AJ;

The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3.-5. Linked nucleosides or their salts, At least one internucleoside linkage is not a phosphoditester linkage and at least one internucleoside linkage is not a phosphoditester linkage and at least one internucleoside comprises a base. Sequences of the invention are useful for hinding to a DNA duplex target sequence via either CT or GT triplex treating diseases caused by virtues and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and complexing target gene expression. They are also useful in gene therapy. The present sequence is an oligomucleotide used to generate duplex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense therapy; infection; cardiovascular disorder; immune reaction; gene therapy; virucide; cytostatic; antibacterial; antiinflammatory; cancer; cardiant; DNA-RNA hybrid; ss.
  /note= "5-(1-propynyl)-2'-deoxycytidine; This base is given as N in the sequence shown as SEQ ID NO: 5 in the sequence listing"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New oligomers useful for binding to DNA duplex target sequence and for treating e.g. diseases caused by viruses and inflammatory conditions comprise at least three 3'-5' linked nucleosides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ON-36 oligonucleotide used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                           Gutierrez AJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8XXXXXXXXXXXXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ઠે
                                   The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprise at least three 3'-5' linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful for inhaling motifications at a sequence via either or or off triplex helix binding motifications they are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and conditions to modulating target gene expression. They are also useful in gene therapy. The present sequence is used in the exemplification of triple helix structures. This sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /*tag= d

                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprise at least three 3'-5' linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least for binding to a DNA duplex target sequences of the invention are useful for binding to a DNA duplex target sequence via either CT or GT triplex helix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions,
                                                                                                                                                                                                                                                                                                                 mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pudlo J;
The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprise at least three 3.-5. linked mucleosides or their saits. At least one internucleoside linkage is not a phosphoditester linkage and at least one internucleoside linkage is not a phosphoditester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful for hinding to a DNA duplex target sequence via either CT or GT triplex helix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for disgnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and therapy. The present sequence is an oligomucleotide useful in gene therapy. The present sequence is an oligomucleotide useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "5-(1-propynyl)-2'-deoxyuridine; This base is given as N in the sequence shown as SEQ ID NO: 13 in the sequence listing"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense therapy, infection, cardiovascular disorder, immune reaction, gene therapy, virucide, cytostatic, antibacterial, antiinflammatory;
                                                                                                                                                                                                                               New oligomers useful for binding to DNA duplex target sequence and for treating e.g. diseases caused by viruses and inflammatory conditions comprise at least three 3'-5' linked nucleosides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3.-5. Innked nucleosides or their salts. At least comprises at least three 3.-6. Innked nucleosides their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequence wit either or or of triplex of or binding to a LNA duplex target sequence via either or or off triplex treating diseases caused by viruses and for diagnostic applications to treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and cardiovascular disorders, immune reactions and bacterial in gene therapy. The present sequence is an oligomicleotide used to generate therapy. The present sequence is used in the exemplification of the conditions.
                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "5-(1-propynyl)-2'-deoxycytidine, This base is given as N in the sequence shown as SEQ ID NO: 47 in the

The oligomers oncomprise at least three 3 -5 linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful for binding to a DNA duplex target sequence via either CT or GT triplex helix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for disquostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and for modulating target gene expression. They are also useful in gene therapy. The present sequence is an oligomucleotide useful in gene
                                                             /mod_base= OTHER
/note= "5-(1-propynyl)-2'-deoxycytidine; This base is
given as N in the sequence shown as SEQ ID NO: 47 in the
sequence listing"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense therapy, infection, cardiovascular disorder, immune reaction, gene therapy, virucide, cytostatic; antibacterial; antiinflammatory; cancer, cardiant, RNA-DNA hybrid, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New oligomers useful for binding to DNA duplex target sequence and for treating e.g. diseases caused by viruses and inflammatory conditions comprise at least three 3'-5' linked nucleosides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

```
The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprise at least three 3-5' linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful for binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to treating diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, and cancers. The oligomers immune reactions and bacterial infections and cancers are disorders, immune reactions and bacterial infections and cancers. The present sequence is an oligomicleotide used to generate therapy. The present sequence is used in the exemplification of the internal of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /mod_base= OTHER
/note= "5-methyl-2'-deoxycytidine; This base is given as
N in the sequence shown as SEQ ID NO: 9 in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense therapy, infection, cardiovascular disorder, immune reaction, gene therapy, virucide, cytostatic, antibacterial, antiinflammatory, cancer, cardiant, RNA-DNA hybrid, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New oligomers useful for binding to DNA duplex target sequence and fo
treating e.g. diseases caused by viruses and inflammatory conditions
comprise at least three 3'-5' linked nucleosides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprises at least three 3.-5. linked nucleosides or their sailts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage. Sequences of the invention are useful for binding to a DNA duplex target sequence via either or or off triplex helix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for disgnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and cardiovascular disorders, immune reactions and bacterial infections and the modulating target gene expression. They are also useful in gene therapy. The present sequence is an oligomicleotide used to generate triple helix structures. This sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                      listing"

                                                                                                                                                                                                                                                                                                                             The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprise at least three 3-5' linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodicaster linkage and at least one internucleoside comprises a base. Sequences of the invention are useful for inhinging to a DNA duplex target sequence via either CT or GT triplex helix binding not if and in antisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and therapy. The present sequence is an oligomucleotide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense therapy, infection, cardiovascular disorder, immune reaction, gene therapy, virucide, cytostatic; antibacterial; antilnflammatory; cancer, cardiant, ss.
                                                                                                                                                                                                          New oligomers useful for binding to DNA duplex target sequence and for treating e.g. diseases caused by viruses and inflammatory conditions comprise at least three 3'-5' linked nucleosides.

The oligomers comprise at least three 3.-5' linked nucleosides or their salts. At least comprises a base three 3.-5' linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful for binding motif and in antisense therapies. They are also used for triplex helix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and for modulating target gene expression. They are also used to generate therapy. The present sequence is an oligomucleotide used to generate triple helix structures. This sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            or 5-(1-

The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comparise at least three 3'-5' linked mucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful for hinding to a DNA duplex target sequence via either CT or GT triplex treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and the modulating target gene expression. They are also useful in gene therapy. The present sequence is an oligomucleotide used to generate triple helix structures. This sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antisense therapy, infection, cardiovascular disorder, immune reaction, gene therapy, virucide, cytostatic, antibacterial, antiinflammatory; cancer, cardiant, ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New oligomers useful for binding to DNA duplex target sequence and for treating e.g. diseases caused by viruses and inflammatory conditions comprise at least three 3'-5' linked nucleosides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

The present invention describes a method for detecting mutations associated with anti-HIV drug resistance in a patient by detecting at least one of the mutations K103N/R, V106A/IL, Y181CI, M184V/I, Y188L, G190A/S/R, T215Y/F/D/S/A and/or O151M/L in the reverse transcriptase (RT) of HIV strains in a biological sample using a specific set of probes optimised to function together in a reverse-hybridisation assay. The method and the nucleic acid sequences used in the method are useful for determining viral mutations and/or polymorphisms in the HIV RT gene associated with resistance. The probes are useful for the genetic detection, preferably in vitro detection of the mutations K103N/R, V106A/IL, Y18IC/I, Q15IM/L, M184V/I, Y188L, G190A/S/R and/or mutation is associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of a rapid, reliable and precise assay or determination and monitoring of antivisal drug resistance or mutations associated with drug resistance of viruses containing RT genes. ABZ33759 to ABZ34642 represent HIV RT security of the present and provides and probes which are used in the exemplification of the present
                                                                                                Detecting mutations associated with anti-HIV drug resistance comprises detecting at least one of the mutations in the HIV reverse transcriptase gene by using probes optimized to function together in a reverse-hybridization assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human immunodeficiency virus; HIV; reverse transcriptase; RT; enzyme;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprise at least three 3-5. Innked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequence via either CT or GT triplex their binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for diagnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and the antiput arget gene expression. They are also useful in gene therapy. The present sequence is a target DNA used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human immunodeficiency virus; HIV; reverse transcriptase; RT; enzyme; detection; mutation; anti-HIV drug resistance; polymorphism; resistance;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                New oligomers useful for binding to DNA duplex target sequence and for treating e.g. diseases caused by viruses and inflammatory conditions comprise at least three 3'-5' linked nucleosides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HIV-1 reverse transcriptase mutation detection probe SEQ ID NO:880.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .

The present invention describes a method for detecting mutations associated with anti-HIV drug resistance in a patient by detecting at least one of the mutations K103N/R, V106A/IL, V181C1, M184V/I, Y18EL, C190A/S/R, T215Y/F/D/S/A and/or Oli1M/L in the reverse transcriptase (RT) of HIV strains in a biological sample using a specific set of probes of HIV strains in a biological sample using a specific set of probes of HIV strains in a biological sample using a specific set of probes of the mutation together in a reverse-hybridisation assay. The method and the nucleic acid sequences used in the method are useful for determining viral mutations and/or polymorphisms in the HIV RT general sociated with resistance. The probes are useful for the genetic detection, preferably in virto detection of the mutations K103N/R, V106A/IL, Y18IC/I, Ol51M/L, M184V/I, Y188L, G190A/S/R and/or call as associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of antiviral drug resistance of mutation associated with anti-HIV drug resistence of viruses containing RT genes. AB234642 represent HIV RT sequences and probes which are used in the exemplification of the present
Detecting mutations associated with anti-HIV drug resistance comprises detecting at least one of the mutations in the HIV reverse transcriptase gene by using probes optimized to function together in a reverse-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated, purified human nucleic acid (1) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognestic markers of cancer, especially of the colon and panoreas. ABK31900-ABK32770 represent human colon and panoreatic cancer. SAGE tags of the invention

The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mENA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer SAGE tags of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (Serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to an isolated, purified human nucleic acid (1) that has the same sequence as a mRNA found in humans and is a SAGB serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABKX1900-ABXX2770 represent human colon and pancreatic cancer SAGE tags of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Probe, polymorphism detection; mutation detection; disease diagnosis; microbial identification; ss.

SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABKG1900-ABK32770 represent human colon and pancreatic cancer SAGE tags of the invention

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                  New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme; HCV expression, HCV replication, cirrhosis, virucide, liver failure, hepatoccellular carcinoma; HCV infection, drug therapy, type I interferon; interferon alpha; interferon beta; cytostatic, interferon gamma; consensus interferon, hepatotropic, antiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleotide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, and micrail for e.g. analytical applications, disease diagnosis and microhian identification. The present sequence was used to illustrate the invention
                                                                                                                                                                                                                                             Fluorescently-labeled nucleic acid probes for assaying nucleic acids and their polymorphism and mutation, particularly useful in science and medicine for e.g. andlytical applications, disease diagnosis and microbial identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribosyme; HCV expression, HCV replication, cirrhosis, virucide; liver failure, hepatocellular carcinoma, HCV infection, drug therapy, type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon; hepatotropic; autiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.

```
The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a harmerhead (HH). The carginatic nucleic acid or ribozyme is in a harmerhead (HH) or hairpin of the substrate sequences defined in the specification. The HCV carbozymes are useful for modulating the expression and/or repplication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substract for a HCV harmerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme; HCV expression, HCV replication; cirrhosis, virucide; liver failure; hepatccellular carcinoma; HCV infection, drug therapy; type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon; hepatctropic; antiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.
                            New ribozymes targeting RNA derived from hepatitis C virus inhibit vireplication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hepatitis C virus substrate #653 for HCV hammerhead ribozyme #653.

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The cargymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprises sequences complementary to one of the substrate sequences defined in the specification. The HCV control of the substrate sequences defined in the specification. The HCV control of the vibozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially circation alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the print of printed specification. The complete sequence data for this patent was contained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ..

New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enzymatic nucleic acid; RNA cleavage; Hepatitis C virus infection; HCV ribozyme; HCV expression; HCV replication; cirrhosis; virucide; liver failure; hepatocellular carcinoma; HCV infection; drug therapy; type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon; hepatotropic; autiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New ribozymes targeting RNA derived from hepatitis C virus inhibit v:

The present invention relates to enzymatic nucleic acids which conspectically cleave RNA derived from Hepatitis C virus (HCV). The reargantic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin confirmatic nucleic acid or ribozyme is in a hammerhead (HH) to hairpin arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV confirmation are sequences of the substrate sequences defined in the specification. The HCV confirmation are also useful for modification of HCV They can be used to treat cirrhosis, liver failure and/or chepatocallular carcinoma. The HCV ribozymes are also useful for treating confirmation approach the rapid therapies, particularly type I interferon, especially confirmation alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) inboxyme. Note: Some of the sequence data for this patent did not form part of the complete confirmation are consensus interferon in consensus consensus confirmation with a complete sequence data for this patent was considered in electronic formet directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme, HCV expression, HCV replication, cirrhosis, virucide, liver failure, hepatocellular carcinoma, HCV infection, drug therapy, type I interferon, interferon alpha, interferon beta, cytostatic, interferon gamma; consensus interferon, hepatotropic, antiinflammatory, substrate, hammerhead ribozyme, HH ribozyme, 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hepatitis C virus substrate #949 for HCV hammerhead ribozyme #949.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            쉽
                                                                                         The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The cnzymatic nucleic acid or ribozyme is in a harmerhead (HH). The cnzymatic nucleic acid or ribozyme is in a harmerhead (HH). The characters conducted the substrate sequences defined in the specification. The HCV or thosymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV harmerhead (HH) ribozyme. Note: Some of the sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enzymatic nucleic acid, RNA cleavage; Hepatitis C virus infection; HCV ribozyme; HCV expression; HCV replication; cirrhosis; virucide; liver failure; hepatocellular carcinoma; HCV infection; drug therapy; type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon; hepatotropic; antiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

pecifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV cone of the used to treat cirrhosis, liver failure and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Enzymatic nucleic acid; RNA cleavage; Hepatitis C virus infection; HCV ribozyme; HCV expression; HCV replication; cirrhosis; virucide; liver failure; hepatocellular carcinoma; HCV infection; drug therapy; type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon; hepatocropic; antiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hepatitis C virus substrate #776 for HCV hammerhead ribozyme #776.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The
enzymatic nucleic acids which

enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the pobatined in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides the human neuropeptide Y (NPY) gene and single nucleotide polymorphisms (SNPs) identified therein. The sequence can be used in the treatment of disorders associated with NPY, including atherosclerosis, obesity, psychological disorders and alcoholism. The present sequence is an allele specific probe used to isolate the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New genetic variants of the human Neuropeptide Y (NPY) gene useful for treating disorders affected by abnormal expression or function of NPY

                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides the human neuropeptide Y (NPY) gene and single nuclectide polymorphisms (SNPs) identified therein. The sequence can be used in the treatment of disorders associated with NPY, including atherosclerosis, obesity, psychological disorders and alcoholism. The present sequence is an allele specific probe used to isolate the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; CYP7A1; hepatotropic; antilipaemic; cholesterol disorder; cirrhosis; bile disorder; hypertriglyceridaemia;
                                                                                                                                                                                                                                                                                                                                                             New genetic variants of the human Neuropeptide Y (NPY) gene useful for treating disorders affected by abnormal expression or function of NPY isogene e.g., atherosclerosis or obesity.

The invention relates to a novel polymorphic variant of a sequence of CYP7A1 protein or its fragment. The polymorphic was the performance and antilipaemic activity. The polymorphic variants are useful in studying the expression and function of CYP7A1, in expressing CYP7A1 protein for use in screening candidate daugs to treat diseases related to CYP7A1 activity, in studying the effect of the variation on the biological activity of CYP7A1, and the binding affinity of candidate daugs targeting cYP7A1 for the treatment of disorders such as cholesterol and bile disorders. Haplotyping methods are useful in validating CYP7A1 as a candidate target for treating a specific condition or disease predicted to associated with CYP7A1 activity, or in the dealin of cinical trials of candidate drugs for treating a specific condition or disease associated with CYP7A1 activity, or in the dealin or disease associated with CYP7A1 activity, such as cirrhosis, familial trials of candidate drugs for treating a cirrhosis, familial and also useful for studying expression of the CYP7A1 isogenes in vivo, for in vivo screening and testing of drugs targeted against CYP7A1 protein, and left each metabolism. The present sequence represents an election of the left metabolism. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New cytochrome P450 subfamily VIIA (cholesterol 7 alphamonooxygenase) polypeptide 1 gene variants, useful for studying the expression and activity of CYP7A1 and screening drugs for treating disorders of cholesterol and bile metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Similarity 85.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method for obtaining typing information about several variable sites within target nucleic acid, or typing one or more nucleic acid molecules. The methods of the invention are useful for typing one or more nucleic acid molecules containing two or more variable sites, preferably nucleic acid molecules containing theme or more variable sites are typed, where three or more primer excension reactions are performed. The method is also useful for diagnosis of pathological conditions characterized by the presence of specific nucleic acid molecule(s). The methods are particularly suited for identifying microbial species or their subtypes, and in typing procedures e.g. typing of polymorphisms, tissue typing or in clinical applications. The sequence of the presence of profinors. The sequence represents a PCR primer used to sequence fragment 61118 of the CYP2D6 gene, which is a member of the cytochrome P450 gene superfamily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Triple-helix formation; purine-rich target sequence; double-helix DNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         gene expression; regulatory sequence; pathogenic double-stranded DNA; pathogenic bacteria; virus; replication; virulence; cancer; oncogene suppression; cancerous cell; cytostatic; antimicrobial; ss.
                                                                                                                                                                                                                                                                        Typing nucleic acid for obtaining information about several variable sites involves simultaneously or sequentially performing two or more primer extension reactions, and determining the pattern of nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical nucleic acid comprising first can discend substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel of orientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helical capplications, where gene expression is controlled by selective triple-helical formation within expression recontrolled by selective triple-helic acid. The method has the sequence of the coligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be consent to parthogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for replication or virulence, reducing their pathogenicity. Alternatively, the oligonucleotides can be used in the genome of pathogen of the pathogen which is not found in the genome of pathogen of riple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helix suppression of specific oncogenes in cancer treatment by way of triple-helix origin. Such therapeutic oligonucleotides are capable of forming triple-helix origin. The present sequences in cancerous cells containing the activated concogenes, so preferentially killing or repressing the cancer causing cells. The present sequence sent expresents an oligonucleotide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /mod_base= OTHER
/note= "C is covalently linked to Lys(Flu)-Lys(Flu) where
Flu= 5-(and 6)-carboxyfluoroescein, optional"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Probe; 23S rRNA; 16SrRNA; tuberculosis; MTC; MOTT; peptide nucleic acid; mycobacterium tuberculosis complex; precursor rRNA; rDNA; 5S rRNA; 8s; mycobacterium other than tuberculosis.
                                                                                                                                                                                     A triple-helix comprising a double helical nucleic acid (DHNA) and an oligomuclectide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to control gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present invention relates to a method for the transient immortalisation of cells by introducing immortalisation proteins into them from the outside. The method is used to immortalisation proteins transiently to allow their expansion, particularly to produce transplant material for regenerating organs, for treating chronic (degenerative) diseases, e.g. in cases of cardiac infarct (with simultaneous reduction in the risk of congestive heart failure and future infarcts) or chronic bone degeneration (osteoporcsis), for regeneration of the liver, for treating Parkinson's disease (using dopaminrsgic cells) and for ex vivo production of heart and venous valves. The present sequence is a PCR primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                        Transient immortalization of cells, useful for preparing transplant material and for organ regeneration, by supplying immortalizing proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 15 BP; 3 A; 6 C; 3 G; 3 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a peptide nucleic acid capable of hybridising to a target sequence of Mycobacterial IDNA, precursor FRNA or FRNA (5S, 16S or 235) forming detectable hybrids. Also included are detecting a target sequence of mycobacteria in a sample comprising contacting FRNA or FDNA in the sample with peptide nucleic acid probes (hybridisation takes place between the probe and rhe FRNA or FDNA, observing or measuring any formed detectable hybrids and relating the observation or measurement to the presence of a target sequence of mycobacteria in particular or probes are used for detecting a target sequence of MTC (and distinguishing them from mycobacterianment than tuberculosis, MOTT) present in a sample, e.g. sputum, laryngeal swabs, gastric lavage, bronchial washings, biopsies, aspirates, expectorates, body fluids, urner, tissue sections as well as food samples, soil, air and water camples and their cultures. The probe is able to penetrate the cell wall of the mycobacterial in the mycobacterial in the mycobacterial of the mycobacterial cells, therefore avoiding a risk of interfering with the morphology of the course.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transient immortalisation; immortalisation protein; transplant; PCR; primer; ss; cardiant; osteopathic; hepatotropic; antiparkinsonian; organ regeneration; degenerative disease; cardiac infarct; bone degeneration; osteoporosis; liver regeneration; barkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                        Peptide nucleic acid probes for detecting target sequences of Mycobacteria in samples, e.g., sputum, which are capable of hybridizing to a target sequence of mycobacterial rDNA, precursor rRNA or rRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

The invention describes an oligonucleotide compound with intermucleoside linkages comprises at least one nucleoside. The compounds are used in oligonucleotide-based diagnosis to detect presence or absence of target gene sequences to which they specifically bind and separation through triplex binding. They are also useful as linkers or spacers in preparing absorption matrices, immobilised enzymes for process control or immunoassay reagents; as monomers to provide access to polymers having pendant functionalities; as cation exchange agents in the preparation of molecular sieves, textiles, fibres, films and formed articles; and as polyfunctional surfactants. The composition improves triplex affinity capture purification and enhances triplex binding. This sequence represents a novel oligonucleotide capable of binding to a polymucleotide duplex to form a triplex structure useful in diagnosis
                                                                                                                      New oligonucleotide compound with internucleoside linkages useful in oligonucleotide-based diagnosis comprises at least one nucleoside selected from 2-aminopyridine or 2-pyridone C-nucleosides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 15 BP; 0 A; 5 C; 0 G; 10 T; 0 U; 0 Other;

Novel alcohol oxidase I regulatory nucleotide sequences useful for enhancing expression of genes of interest in a variety of host cells, especially yeast cells.

The invention relates to a 2-aminopyridine C-nucleoside or 2-pyridone C-nucleoside compound, its salt, solvates, resolved enantiomers or purified distrements of formula detailed in the specification. Also included is an oligomer compound comprising a multiplicity of nucleosides linked by internucleoside linkages where at least one nucleoside is a modified nucleoside comprising a 2-aminopyridine C-nucleoside is a modified nucleoside, its salts, solvates, resolved enantiomers or purified diastereomers. The oligomer is useful for detecting the presence, absence or amount of a particular DNA duplex in a sample suspected of containing DNA. The method involves contacting the sample with the oligomer under conditions where a triple helix is formed between the oligomer and the

Example 7; Col 23; 18pp; English.

Disclosure, Fig 6, 66pp, English.

The present sequence represents a consensus sequence of methanol regulated promoters of methylotrophic yeast. The specification describes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel 2-aminopyridine C-nucleoside or 2-pyridone C-nucleoside compound useful for preparing oligonucleotides which are used for detecting specific DNA duplexes in samples.
5' regulatory sequences within the alcohol oxidase 1 (AOX1) promoter region. AOX1 catalyses the oxidation of methanol to formaldehyde. The AOX1 promoter is an inducible promoter, primarily induced by methanol starvation, and represent in response to glucose and ethanol. The AOX1 regulatory sequences can be used to produce expression cassettes and vectors, which are useful for protein production. The regulatory sequences are useful to increase expression of genes of interest in a versiety of host cells, in a research setting to further characterize promoter function and to study peroxisome biogenesis. They are also
                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNase footprint, ds, target, 2-aminopyridine C-nucleoside, 2-pyridone C-nucleoside, triple helix, cation exchange agent, molecular sieve, textile; fibre, film, formed article, polyfunctional surfactant, phase transfer agent, phase transfer catalysis; liquid/liquid ion extraction, optically active material, affinity absorption matrix; immobilised enzyme; immunosassay reagent.

particular DNA duplex . The 2-aminopyridine C-nucleoside or 2-pyridone C-nucleoside compound is useful for preparing oligonucleotides which are useful in oligonucleotide-based diagnosis and separation through triplex binding, as monomers to provide access to polymers having unique pendent functionalities, as comonomers with monomers, for preparation of molecular sleves, textiles, films, and formed articles), as polyfunctional surfactants, as phase transfer agents, in the preparation of molecular sleves, textiles, films, and formed articles), as polyfunctional surfactants, as phase transfer agents, in the synthesis or resolution of other optically active materials, and as linkers or spacers in preparing affinity absorption matrices, immobilised enzymes for process control, or immunoassay reagents. The present sequence is a target sequence (contained in a 370bp restriction fragment) for modified oligonucleotides containing 2-aminopyridine C-nucleoside or 2-pyridone C-nucleosides, used in a DNase footprint assay

The invention relates to a 2-aminopyridine C-nucleoside or 2-pyridone C-
C mucleoside compound, its salt, solvates, resolved enantiomers or purified
CC disatereomers of formula detailed in the specification. Also included is
CC disatereomers of formula detailed in the specification. Also included is
CC nucleoside comprising a multiplicity of nucleosides linked by
internucleoside linkages where at least one nucleoside or 2-pyridone C-
CC nucleoside comprising a 2-aminopyridine C-nucleoside or 2-pyridone C-
CC nucleoside its salts, solvates, resolved enantiomers or purified
diastereomers. The oligomer is useful for detecting the presence, absence
CC or amount of a particular DNA duplex in a sample with the oligomer under
CC onditions where a triple helix is formed between the oligomer under
CC onditions where a triple helix is formed between the oligomer under
CC onditions where a triple helix is formed between the oligomer under
CC onditions where a triple helix is formed between the oligomer under
CC nucleoside compound is useful for preparing oligomerleotides which are
CC nucleoside compound is useful for preparing oligomecleotides which are
CC nucleoside compound is useful for preparing oligomerleotides which are
CC thortionalities as comonomers to provide access to polymers having unique pendent
CC functionalities as comonomers with monomers, for preparing plotymers
CC which are useful as cation exchange agents in the preparation of
CC molecular sieves, textiles, fibres, films, and formed articles), as
CC polyfunctional surfactants, as phase transfer agents, in phase transfer
CC resolution of other optically active materials, and as linkers or spacers
CC process control, or immunoassay reagents. The present sequence is a
CC process control, or immunoassay reagents. The present sequence is a
CC process control, or immunoassay reagents. The present sequence is a
CC process control, or immunoassay reagents. The present sequence is a
CC process control, even which demonstrates to use of the oligomer of the oligo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                               Novel 2-aminopyridine C-nucleoside or 2-pyridone C-nucleoside compound useful for preparing oligonucleotides which are used for detecting specific DNA duplexes in samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNase footprint; ss; probe; 2-aminopyridine C-nucleoside; 2-pyridone C-nucleoside; triple helix; cation exchange agent; molecular sieve; textile; fibre; film; formed article; polyfunctional surfactant; phase transfer agent; phase transfer agent; phase transfer agent; optically active material; affinity absorption matrix; immobilised enzyme; immonassay reagent; DNA-RNA hybrid.

The invention relates to a 2-aminopyridine C-nucleoside or 2-pyridone C-nucleoside compound, its salt, solvates, resolved enantiomers or purified diastersomers of formula detailed in the specification. Also included is an oligomer compound comprising a multiplicity of nucleosides linked by incleoside linkages where at least one nucleoside is a modified nucleoside, its salts, solvates, resolved enantiomers or purified diastersomers. The oligomer is useful for detecting the presence, absence or amount of a particular DNA duplex in a sample suspected of containing DNA. The method involves contacting the sample with the oligomer under containing makes a triple helix is formed between the oligomer under particular DNA duplex. The 2-aminopyridine C-nucleoside or 2-pyridone contacting is useful for preparing oligonucleotides which are particular DNA duplex. The 2-aminopyridine C-nucleoside or 2-pyridone contacting as monomers to provide access to polymers having unique pendent closeleoside compound is useful for preparing oligonucleotides which are useful in oligonucleotide-based diagnosis and separation through triplex binding, as monomers to provide access to polymers having unique pendent closeleosides, textiles, as comenomers with monomers, for preparing polymers to provide access to polymers having unique pendent closeleosides, textiles, as phase transfer agents, in phase transfer catalysis and liquid/liquid ion extraotion, in the synthesis or spacers or peolytion of their optically active materials, and as linkers or spacers contraining RNA nucleotides, used in a base footprint assay, expense containing RNA nucleotides, used in a base footprint assay.
                                                                                                                                                                                                                                                                                                                                                                                                                           Novel 2-aminopyridine C-nucleoside or 2-pyridone C-nucleoside compound useful for preparing oligonucleotides which are used for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         which demonstrates to use of the oligomers of the invention
                                                                                                                                                                                                                                                                                                                                        Gutierrez AJ, Matteucci MD;

Nucleic acid molecule, Hepatitis C virus, HCV, Hepatitis B virus, HBV;

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HCV) or Hepatitis B virus (HCV) or C and enzymatic nucleic acids such as harmerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decory molecules and apramers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds compounds of the invention and/or reusening in the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represente a substrate for one of the HBV enzymatic nucleic acid sequence alsolves in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
RNA stability, RNA expression, RNA synthesis, antisense, enzymeidic acid, hammerhead ribozyme; MNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region, viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

```
The present invention describes a method for typing at least two variable sites of at least one nucleic acid molecule related to cystic fibrosis.

The method comprises: (a) providing at least one extension of agene related to cystic fibrosis; (b) providing at least one extension primer; which binds to different predetermined sites in the nucleic acid molecules, where at least one extension primer is designed to extension at least two potential variable sites in the nucleic acid molecule, and nucleotide; (c) simultaneously or sequentially performing primer extension reactions; and (d) determining the pattern of nucleotide conforming the pattern of nucleotide conforming the pattern of set (c) simultaneously or sequentially performing primer extension to obtain a test pattern, optionally (e) comparing the test pattern of set (c) with one or more reference patterns, in order to type the variable sites of the nucleic acid molecules. Also described: (1) pattern of set of the human cystic fibrosis transmembrane conductance response related to the human cystic fibrosis transmembrane conductance comparising at least one extension primer. The method is useful for typing comprising at least one extension primer. The method is useful for typing to response the variable sites of at least one nucleic acid molecule related to cystic fibrosis. The present sequence represents an oligonucleoride which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Typing at least two variable sites of at least one nucleic acid molecule related to cystic fibrosis by simultaneously or sequentially performing primer extension reactions and determining the pattern of nucleotide
                                                          typing, variable site, cystic fibrosis; human, cystic fibrosis transmembrane conductance regulator; CFTR;
                     Human CFTR related oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 6; Fig 3; 69pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes a method of determining presence or absence of a desired nucleic acid (NA) that contains multiple repeats of a desired nucleic acid (NA) that contains multiple repeats of a providing a treated sample that may contain the desired NA in which several predetermined repeating NA target sequences are hybridised with a probe, analysing for presence of hybridised NA containing the NA probe, and thereby the presence of the desired NA. The method is useful for determining the presence or absence of desired nucleic acids that contain multiple repeats of a predetermined NA target sequence, in a NA sample obtained from a biological sample, where the repeated sequence includes several predetermined repeated sequence that distinguishing human and bacterial NA. The method is highly sensitive, and enables detection and quantification of the presence of a NA without the need to undergo a NA target sequence enrichment step prior to a NA hybrid detection step. The method enables rapid and accurate detection of a desired NA that contains multiple repeats of a NA target sequence. This sequence represents a probe used to detect the human Alu repeat sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Determining presence or absence of desired nucleic acids that contain multiple repeats of predetermined nucleic acid target sequences in a sample, by using nucleic acid hybridization methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Typing at least two variable sites of at least one nucleic acid molecule related to cystic fibrosis by simultaneously or sequentially performing primer extension reactions and determining the pattern of nucleotide incorporation.

Example 6; Fig 3; 69pp; English.

The present invention describes a method for typing at least two variable sites of at least one nucleic acid molecule related to cystic fibrosis. The method comprises: (a) providing at least one nucleic acid molecule of a gene related to cystic fibrosis; (b) providing at least one extension primer, which binds to different predetermined sites in the nucleic acid molecules, where at least one extension primer is designed to extend over at least two potential variable sites in the nucleic acid nucleotide; (c) simultaneously or sequentially performing primer extensions; and (d) determining the pattern of mucleotide incorporation to obtain a test pattern; optionally (e) comparing the pattern of step (c) with one or more reference patterns, in order to type the variable sites of the nucleic acid molecules. Also described: (1) diagnosing the genetic predisposition of states, diseases and drug response related to the human cystic fibrosis transmembrane conductance regulator (CFTR) gene, and (2) a kit for use in the method for typing comprising at least one extension primer. The method is useful for typing at least two variable sites of at least one nucleic acid molecule related to cystic fibrosis. The present sequence represents an oligonucleotide which is used in the exemplification of the present invention.
